REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance: The Applicant filed an amendment received on December 8, 2003. In this amendment, Applicant amended the claims and specification. No new matter was introduced.

With respect to the specification, the changes are approved and the previous objection is withdrawn.

With respect to the claims, the changes are approved and the previous objections and rejections are withdrawn.

Regarding independent claim 1, a review of prior art failed to disclose or make obvious a charged particle energy analyzer arranged to analyze charged particles having a range of energies comprising an electrostatic focusing field defined by equipotentials which extend about an axis and which vary substantially linearly in the direction of said axis and which vary substantially logarithmically in the radial direction orthogonal to said axis whereby charged particles having different energies are brought to a focus by the electrostatic focusing field at different discrete positions on a surface of the detection means.

Claims 2-60 are allowed by virtue of their dependence upon claim 1 or claims that depend upon claim 1.

Art Unit: 2881

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Patent 3,642,214 to Helmer et al. describes an energy analyzer with electrostatic focusing means, a charged particle source, and detection means. However, the reference is silent with respect to an electrostatic focusing field defined by equipotentials which extend about an axis and which vary substantially linearly in the direction of said axis and which vary substantially logarithmically in the radial direction orthogonal to said axis whereby charged particles having different energies are brought to a focus by the electrostatic focusing field at different discrete positions on a surface of the detection means.
